

# Demonstrating dtkbook Markup

Daniel Kaplan

2016-10-29

## Book markup

I particularly like to create Tufte-style books. The `tufte` and `tint` R packages are vergy helpful here, but they don't do everything that's needed.

- Marginal notes. In `tint` and `tufte`, use the `margin_note()` function to create a marginal note. Put it in an inline chunk, like this:  
`margin_note("This goes in the margin.")`

This goes in the margin.

Unfortunately, it's not possible via this mechanism to create a marginal note that has R content: you can't put an inline chunk inside an inline chunk.

The `dtkbook::margin_content()` function works just like `margin_note`, but allows you to put in an inline chunk in the character-string argument. It will be escaped with `@` rather than the back-quote. For instance, here is a simple calculation in a marginal note.

Three plus seven is 10

How is this line formatted?

Another example involves a table like that shown in the margin:

hello

	mpg	cyl
Mazda RX4	21.0	6
Mazda RX4 Wag	21.0	6
Datsun 740	22.8	4
Hornet 4 Drive	21.4	6
Hornet Sportabout	18.7	8

Let's say  
after

Try out the `margin_table()` function

Can we put this in the margin?
